For more than 20 years, Network World has been the premier provider of information, intelligence and insight for network and IT executives responsible for the digital nervous systems of large organizations. Readers are responsible for designing, implementing and managing the voice, data and video systems their companies use to support everything from business critical applications to employee collaboration and electronic commerce.

This book surveys state-of-the-art optimization modeling for design, analysis, and management of wireless networks, such as cellular and wireless local area networks (LANs), and the services they deliver. The past two decades have seen a tremendous growth in the deployment and use of wireless networks. The current-generation wireless systems can provide mobile users with high-speed data services at rates substantially higher than those of the previous generation. As a result, the demand for mobile information services with high reliability, fast response times, and ubiquitous connectivity continues to increase rapidly. The optimization of system performance has become critically important both in terms of practical utility and commercial viability, and presents a rich area for research. In the editors' previous work on traditional wired networks, we have observed that designing low cost, survivable telecommunication networks involves extremely complicated processes. Commercial products available to help with this task typically have been based on simulation and/or proprietary heuristics. As demonstrated in this book, however, mathematical programming deserves a prominent place in the designer's toolkit. Convenient modeling languages and powerful optimization solvers have greatly facilitated the implementation of mathematical programming theory into the practice of commercial network design. These points are equally relevant and applicable in today’s world of wireless network technology and design. But there are new issues as well: many wireless network design decisions, such as routing and facility/element location, must be dealt with in innovative ways that are unique and distinct from wired (fiber optic) networks. The book specifically treats the recent research and the use of modeling languages and network optimization techniques that are playing particularly important and distinctive roles in the wireless domain.

Broadband communication expands our opportunities for entertainment, e-commerce and work at home, health care, education, and even e-government. It can make the Internet more useful to more people. But it all hinges on higher capacity in the “first mile” or “last mile” that connects the user to the larger communications network. That connection is often adequate for large organizations such as universities or corporations, but enhanced connections to

homes are needed to reap the full social and economic promise. *Broadband: Bringing Home the Bits* provides a contemporary snapshot of technologies, strategies, and policies for improving our communications and information infrastructure. It explores the potential benefits of broadband, existing and projected demand, progress and failures in deployment, competition in the broadband industry, and costs and who pays them. Explanations of broadband's "alphabet soup" — HFC, DSL, FTTH, and all the rest — are included as well. The report's findings and recommendations address regulation, the roles of communities, needed research, and other aspects, including implications for the Telecommunications Act of 1996.

Apoptosis is an essential biochemical process in cell turnover, development, and chemical-induced cell death. Current knowledge and ongoing research of apoptosis highlight our understanding in designing the therapeutic approaches for several diseases. This book covers four main sections: "Apoptosis and Necrosis," "Apoptosis Inducers," "Proteasome and Signaling Pathways in Apoptosis," and "Radiation-Based Apoptosis." The first section implicitly describes the differences between apoptosis and necrosis processes. The following section elaborates the small molecule-induced apoptosis. Then, the third section deals with proteasome and signaling pathways and finally, resistance to chemotherapy and electromagnetic radiation is covered in the last section. Overall, the book deals with pathways for manipulating apoptosis and provides a unique perspective to the scientists.

Reading Migration and Culture locates itself within the recent preoccupation in literary studies with modernity, migration and diaspora, and the theories that are deployed in trying to account for them. Its central argument is that 'global' readings of migration in relation to a general 'postcolonial condition' elides local referents of history, social life and geography. East African Asians, a term used to refer to people of sub-continental Indian descent in the region, occupy an important, yet often neglected role, in the history of the former British Empire. Unlike their counterparts in the Caribbean, Fiji and South Africa, they have had a closer connection to the India, which has been an important focus of their imagination. This book examines the local histories and discourses that underpin East African Asian literature against the categories that have evolved for conceptualizing diaspora, especially within postcolonial studies. Its focus is on the cultural codes that diasporic East African Asians have forged in an attempt to come to terms with a history of dislocation and how those codes find form in writing. In probing these issues, it opens up larger questions of alienation, domesticity, material culture, gastropolitics, memory, nationalism and the allegorical construction of gender and sexuality. In a significant sense, this book shows that East African Asian writing is rooted in a fundamental sense of the local East African scene but at the same time draws its identity from a wider cartography that includes the Indian sub-continent, Africa and the Euro-American sites in which the majority of the writers live. Writers covered include M.G. Vassanji, Yasmin Alibhai-Brown, Nanji Kalidas Mehta, Peter Nazareth, Jameela Siddiqi, Shailja Patel, Bahadur Tejani and Ghalib Shiraz Dhalla.

Advanced Antenna Systems for 5G Network Deployments: Bridging the Gap between Theory and Practice provides a comprehensive understanding of the field of advanced antenna systems (AAS) and how they can be deployed in 5G networks. The book gives a thorough understanding of the basic technology components, the state-of-the-art multi-antenna solutions, what support 3GPP has standardized together with the reasoning, AAS performance in real networks, and how AAS can be used to enhance network deployments. Explains how AAS features impact network performance and how AAS can be effectively used in a 5G network, based on either NR and/or LTE Shows what AAS configurations and features to use in different network deployment scenarios, focusing on mobile broadband, but also including fixed wireless access Presents the latest developments in multi-antenna technologies, including Beamforming, MIMO and cell shaping, along with the potential of different technologies in a commercial network context Provides a deep understanding of the differences between mid-band and mm-Wave solutions
