The first comprehensive book to uniquely combine the three fields of systems engineering, operations/production systems, and multiple criteria decision making/optimization Systems engineering is the art and science of designing, engineering, and building complex systems—combining art, science, management, and engineering disciplines. Operations and Production Systems with Multiple Objectives covers all classical topics of operations and production systems as well as new topics not seen in any similiar textbooks before: small-scale design of cellular systems, large-scale design of complex systems, clustering, productivity and efficiency measurements, and energy systems. Filled with completely new perspectives, paradigms, and robust methods of solving classic and modern problems, the book includes numerous examples and sample spreadsheets for solving each problem, a solutions manual, and a book companion site complete with worked examples and supplemental articles. Operations and Production Systems with Multiple Objectives will teach readers: How operations and production systems are designed and planned How operations and production systems are engineered and optimized How to formulate and solve manufacturing systems problems How to model and solve interdisciplinary and systems engineering problems How to solve decision problems with multiple and conflicting objectives This book is ideal for senior undergraduate, MS, and PhD graduate students in all fields of engineering, business, and management as well as practitioners and researchers in systems engineering, operations, production, and manufacturing.

A fresh and timely approach to nurturing wise, resilient, and flexible leadership in a world of growing complexity Leaders tend to obstinately stick to the leadership style that brought them most success in the past, usually one of two extreme styles: functional leadership that focuses on operational excellence or smart leadership that focuses on growth. When a leader's focus is too functional, the organization becomes introverted and can focus too much on bottom-line profitability while missing out on top-line growth opportunities. But when leaders focus too much on smart leadership, the organization may experience quick growth but lose its effectiveness quickly. From Smart to Wise offers a new approach that balances the two styles to achieve a form of wise leadership that is both functional and smart. Drawing on inspiring real-life stories of historical and contemporary wise leaders such as Bill Gates, Warren Buffet, and even Mahatma Gandhi, the authors identify six characteristics of wise leaders and offer a practical framework to help readers develop their own style of wise leadership. A timely and innovative approach to leadership Written by noted speakers who conduct dozens of keynote speeches and workshops, training thousands of people annually

Music has been a vital part of leisure activity across time and cultures. Contemporary commodification, commercialization, and consumerism, however, have created a chasm between conceptualizations of music making and numerous realities in our world. From a broad range of perspectives and approaches, this handbook explores avocational involvement with music as an integral part of the human condition. The chapters in The Oxford Handbook of Music Making and Leisure present myriad ways for reconsidering and refocusing attention back on the rich, exciting, and emotionally charged ways in which people of all ages make time for making music. The contexts discussed are broadly Western, including an eclectic variety of voices from scholars across fields and disciplines, framing complex and multifaceted phenomena that may be helpfully, enlighteningly, and perhaps provocatively framed as music making and leisure. This volume may be viewed as an attempt to reclaim music making and leisure as a serious concern for, amongst others, policy makers, scholars, and educators who perhaps risk eliding some or even most of the ways in which music – a vital part of human existence – is integrated into the everyday lives of people. As such, this handbook looks beyond the obvious, asking readers to consider anew, "What might we see when we think of music making as leisure?"

This book brings together the work of historians and sociologists with perspectives from media studies, communication studies, cultural studies, and information studies to address the origins, practices, and possible futures of contemporary machine learning. From its foundations in 1950s and 1960s pattern recognition and neural network research to the modern-day social and technological dramas of DeepMind's AlphaGo, predictive political forecasting, and the governmentality of extractive logistics, machine learning has become controversial precisely because of its increased embeddedness and agency in our everyday lives. How can we disentangle the history of machine learning from conventional histories of artificial intelligence? How can machinic agents' capacity for novelty be theorized? Can reform initiatives for fairness and equity in AI and machine learning be realized, or are they doomed to cooptation and failure? And just what kind of “learning” does machine learning truly represent? We empirically address these questions and more to provide a baseline for future research.
