A trader's dream: Sitting with a cool beer on the beach while his computer breeds money with automated trading. Can this actually work? It depends. This textbook covers the "algorithmic" part of algorithmic trading - not with "technical indicators", but with modern methods based on solid math and statistics. The author has developed so far about 600 trading systems for institutes and private traders, and writes about his experiences on the blog "The Financial Hacker". In his book you'll learn the tricks and traps, which methods work and which don't, and how to develop a trading system from the first idea until going live. Many example systems are presented with new trading methods, such as spectral analysis and statistical filters. You're introduced in proper testing with solid Walk Forward, Montecarlo, and Reality Check methods. All examples come with code ready to run. No matter if you are a beginner or a seasoned algo developer, this book will provide new insights into algorithmic trading. "Johann Christian Lotter has succeeded in writing an interesting and, above all, honest book: Instead of picture-book examples, it presents working code, instead of pink rhetoric, hard truth. All prospective traders interested in algorithmic trading should take a look at this book." TRADERS' August 2016

This book teaches financial engineering in an innovative way: by providing tools and a point of view to quickly and easily solve real front-office problems. Projects and simulations are not just exercises in this book, but its heart and soul. You will not only learn how to do state-of-the-art simulations and build exotic derivatives valuation models, you will also learn how to quickly make reasonable inferences based on incomplete information. This book will give you the expertise to make significant progress in understanding brand new derivatives given only a preliminary term sheet, thus making you extraordinarily valuable to banks, brokerage houses, trading floors, and hedge funds. Financial Hacking is not about long, detailed mathematical proofs or brief summaries of conventional financial theories; it is about engineering specific, useable answers to imprecise but important questions. It is an essential book both for students and for practitioners of financial engineering. MBAs in finance learn case-method and standard finance mainly by talking. Mathematical finance students learn the elegance and beauty of formulas mainly by manipulating symbols. But financial engineers need to learn how to build useful tools, and the best way to do that is to actually build them in a test environment, with only hypothetical profits or losses at stake. That's what this book does. It is like a trading desk sandbox that prepares graduate students or others looking to move closer to trading operations.
