7 Day Programmable, Touch Screen, Energy Star, Alexa Ready is on sale for $87.04 (reg. $169.00) * Shark ZU782 Rotator Lift-Away DuoClean Pro Upright Vacuum with Self-Cleaning Brushroll ...

The 'machines' as we see them today use certain level of technology which is contemporary to today's standards. In garment manufacturing, activities have been mechanized over a period of time and mechatronics and electronics are added to enable better productivity, repeatability of output and consistency of quality. In the last one-and-a-half decade, the integration of computer and information technology made the machines capable of generating, storing and transmitting data automatically with added ease of diagnostics and quick repair. The future will likely see these machines support sustainable practices while becoming energy-efficient and caring for the environment. The book traces the evolution of technology for different garment manufacturing machinery and equipment and how the gradual improvement of features has supported the users.

Drawing on the experiences of four major EC countries, this book documents the way computer technology has changed the pattern of women's work in the manufacturing sector. The sixteen contributors are leading authorities on the subject and analyse how technology has transformed employment in the clothing industry, which is still the major employer of female blue-collar workers in the EC. The contributors assess the aspects of computerisation that particularly affect women's employment opportuni- ties: flexible hours, flexible work locations and flexible specialisation. The book also contains evaluations of post-Fordism and human-centred technology, two leading issues in the debate about the applications of artificial intelligence and computer-aided technology. These essays highlight a growing polarisation in the job market and suggest training schemes which can equip women for technical and managerial employment. This is a pioneering work: so far, most of the literature on women and computerisation has focused on office automation and data processing. Computer-aided Manufacturing and Women's Employment makes an important contribution to the fields of technology, employment, women's work, business management and trade union studies.

Apparel production is a complex process often involving an international supply chain which must respond rapidly to the changing needs and tastes of consumers. This important book discusses the technological improvements which are transforming the speed, flexibility and productivity of the industry. The first part of the book reviews advances in apparel design. There are chapters on modelling fabric and garment drape, computer-aided colour matching, yarn design and pattern making. Other chapters discuss key issues in apparel sizing and fit, and the role of 3-D body scanning in improving garment fit and design. The second part of the book surveys advances in production, beginning with product development before looking at advances in knitting, sewing, printing, finishing and fabric inspection. With its distinguished editor and international team of contributors, Advances in apparel production is a standard work for those researching and working in this important industry. Discusses the technological improvements transforming the speed, flexibility and productivity of the industry Examines computer aided colour matching, garment drape and yarn design Explores key issues in apparel sizing and fit, the role of three-dimensional body scanning in improving garment fit and design

This student book contains: questions and activities to develop the students skills; summarized key points; and a section on coursework.

This book assesses economic cooperation and industrial integration between the United States and Mexico from the perspective of six specific industries—automobiles, computers, food processing, petrochemicals, pharmaceuticals, and textiles and apparel.
