In this excellent new book, specialist dietitians Isabel Skypala and Carina Venter bring together a team of expert authors to separate fact from fiction and provide the reader with an authoritative and practical guide to diagnosing, managing and preventing food allergy and intolerance.

With a number of well-publicised deaths caused by food-induced anaphylaxis in recent years, there is widespread recognition that preventative measures and prompt action are essential to living with this condition. This practical guide enables suffers to take a more pro-active role in its prevention. Information on special diets, restrictive diets and eating away from home, medical terms explained in layman's language an a comprehensive list of organisations to contact for further help and support are also included.

This book offers a handy reference guide to anaphylaxis, including diagnosis and treatment. It covers food, drug allergy and venom allergies, allergic rhinitis and asthma, anaphylaxis related to intravenous drug administration, exercise-induced anaphylaxis, latex allergy, idiopathic anaphylaxis, and also discusses applied treatment modalities that cause anaphylaxis, such as various forms of immunotherapy. Providing detailed information on three recently launched epinephrine auto-injectors, this guide is an invaluable tool for otorhinolaringologists, pediatric and adult allergologists, pulmonologists general practitioners and emergency physicians as well as patients.

This book, based on a recent German publication, offers an overview of basic data and recent developments in the groundbreaking field of molecular allergology. It comprehensively explores the origin and structure of single allergen molecules ("components") and their utility in improving the management of type I, IgE-mediated allergic reactions and disorders like allergic respiratory diseases, food allergies, and anaphylaxis. Highly specific testing, called component-resolved diagnostics, aims to identify and utilize single molecules. Over 200 single allergens from plant or animal sources have been applied to single or multiplex laboratory testing for the presence of allergen-specific IgE. This leap in assay sensitivity and specificity has led to three major advances in patient management: discrimination between primary allergic sensitization and complex cross-reactivity, recognition of IgE profiles for certain allergens and identification of patients most likely to benefit from allergen-specific immunotherapy. The book discusses in detail the benefits and limitations of this 21st century technology, and offers suggestions for the use of molecular allergology in routine clinical practice. It is a "must read" for physicians treating allergic patients as well as scientists interested in natural allergic molecules and their interactions with the human immune system.

Plant Food Allergens is concerned with a paradox of immense, potentially life-threatening significance to about 1 in 100 adults and 1 in 10 children. The paradox is that certain nutritious proteins from wholesome foods can act as if they were harmful, sometimes deadly poisons, to these people who possess an allergy to them. In order to study the complex problems of food allergy a EU funded network, called PROTALL was set up, bringing together a wide range of clinicians and scientists. This important book is largely based on the outcome of its investigations. Written by over 30 acknowledged experts and carefully edited by Dr Clare Mills and Professor Peter Shewry, themselves well known internationally; this important work covers all major aspects of the subject. Commencing with introductory chapters, the comprehensive contents of Plant Food Allergens includes details of the major allergens including: plant lipid transfer proteins, the 2S albumin proteins, the cereal α -amylase/trypsin family, latex and plant chitinases, profilins, bet v 1-homologous allergens and plant seed globulins. The book concludes with important chapters on the assessment of the allergenicity of novel and GM foods, and the monitoring of and technological effects on allergenicity of proteins in the food industry. Plant Food Allergens is an essential purchase for a wide range of scientists and clinicians including plant and agricultural scientists, chemists, allergy specialists, food scientists and technologists, pharmacologists, physiologists and nutritionists. Libraries in all research establishments and universities researching and teaching these subjects will need copies of this important book on their shelves Dr Clare Mills is based at The Institute of Food Research, Norwich, UK. Professor Peter Shewry is based at Rothamsted Research, Harpenden, UK.
